General Purpose

Reconfiguration and deployment of spacecraft formations

Examples:

- Reorientation of formations
- Swap spacecraft
- Rendevous of stacks

Adaptive remeshing

The reconfiguration problem

Problem to solve

- Reconfiguration of N spacecraft in a fixed time T (fixed initial and final position)
- Minimizing fuel consumption
- Collision avoidance

 Assume the spacecraft are in a Halo orbit about L₂ (120,000 km of *z*-amplitude in the Sun-Earth system).
 The procedure is similar if they are in another libration point orbit, about the Earth or in free space.

Governing equations

We consider the linearized equations about the nonlinear orbit, due to the size of the formation:

 $\dot{\mathbf{X}}_i(t) = \mathbf{A}(t)\mathbf{X}_i(t)$

Add of a control $U_i(t) = (0, 0, 0, u_i^x(t), u_i^y(t), u_i^z(t))^t$

 $\dot{\mathbf{X}}_i(t) = \mathbf{A}(t)\mathbf{X}_i(t) + U_i(t)$ $\mathbf{X}_i(0) = \mathbf{X}_i^0, \quad \mathbf{X}_i(T) = \mathbf{X}_i^T$

Objective: find the controls u_i , $i = 1 \dots N$.

◆□▶ ◆□▶ ◆豆▶ ◆豆▶ → 豆 → のへで

Adaptive remeshing

The finite element method

• The FEM is usually a discretization on space, but we considere it on time: we divide the time interval [0, *T*] in a number *M* of smaller intervals (elements) (can be different for each spacecraft).

$$t0 = 0 \quad t1 \quad t2 \qquad tk \qquad tM = T$$

- A delta-v applied to each node.
- Formulate the optimal problem. For each spacecraft, we considere the functional to be minimized:

$$J = \sum_{i=0}^{N} J_i, \quad J_i = \sum_{k=0}^{M} ||\Delta v_{i,k}||,$$

where || * || denote the Euclidean norm.

Adaptive remeshing

Comments on the functional to be minimized

Derivatives of

$$J_i = \sum_{k=0}^{M} \rho_{i,k} ||\Delta \mathbf{v}_{i,k}||$$

are ill conditioned when $||\Delta v||$ are small.

Alternative function to minimize:

$$J_i = \sum_{k=0}^M \rho_{i,k} ||\Delta v_{i,k}||^2.$$

- Derivatives can be calculated in any case.
- The value of J_i is directly related with fuel consume.

Remeshing - 1

Adaptive remeshing

Obtention of the elements

Discretization on time:

- Divide the time interval [0, *T*] in a number *M* of smaller intervals (elements)
- Possibility of use of elements of different length in the same discretization
- The discretization can be different for each spacecraft.
- A delta-v applied to each node.

Adaptive remeshing

◆□▶ ◆□▶ ★ □▶ ★ □▶ → □ → の Q (~

Collision avoidance

• Procedure:

- A sphere evolves each spacecraft.
- The spheres cannot intersect at any time.
- Implementation:
 - Test of the restriction on each element, for each pair of spacecraft.
 - Restrictions enter in the optimal problem in a natural way.
 - Possibility of adding other restrictions in a similar way.

Adaptive remeshing

The uncoupled system

Objective: uncouple the system

$$\dot{\mathbf{X}}(t) = \mathbf{A}(t)\mathbf{X}(t). \tag{1}$$

Jordan form of A(t):

$$D(t) = \begin{pmatrix} \lambda_1(t) & & & \\ & -\lambda_1(t) & & & \\ & & 0 & \lambda_2(t) & & \\ & & -\lambda_2(t) & 0 & & \\ & & & 0 & \lambda_3(t) \\ & & & & -\lambda_3(t) & 0 \end{pmatrix}.$$
(2)

 $\dot{\mathbf{Z}} = D(t)\mathbf{Z}.$

Adaptive remeshing

Equations for the uncoupled system

$$\dot{z}_1 = \lambda_1(t) z_1, \qquad \dot{z}_2 = -\lambda_1(t) z_2$$
 (3)

 $\ddot{z}_1 = (\dot{\lambda}_1(t) + \lambda_1^2(t))z_1, \qquad \ddot{z}_2 = (-\dot{\lambda}_1(t) + \lambda_1^2(t))z_2.$ (4)

$$\dot{z}_3 = \lambda_2(t) z_4, \qquad \dot{z}_4 = -\lambda_2(t) z_3,$$
 (5)

$$\ddot{z}_3 = \frac{\dot{\lambda}_2}{\lambda_2} \dot{z}_3 - \lambda_2^2 z_3, \quad \ddot{z}_4 = \frac{\dot{\lambda}_2}{\lambda_2} \dot{z}_4 - \lambda_2^2 z_4.$$
(6)

Obtain the change of coordinates

Change of coordinates: $\mathbf{x} = P(t)\mathbf{z}$ P(t) is solution of

$$\dot{\boldsymbol{P}}(t) = \boldsymbol{A}(t)\boldsymbol{P}(t) - \boldsymbol{P}(t)\boldsymbol{D}(t). \tag{8}$$

Solved numerically using that:

 $P^{-1}(0)A(0)P(0) = D(0).$

P(0) constructed using the eigenvectors of A(0).

Outline

- Adaptive remeshing
 - Adaptive re-meshing method
 - Numerical results

Changing the mesh discretization

(I) Taking out nodes

- Remove some of the nodes which have a delta-v less than a tolerance *T_m*.
 - If there is only an isolated delta-v less than *T_m*, take off the node.
 - If there are consecutive delta-v less than *T_m*, decrease the density of nodes.

5990

Adaptive remeshing

Changing the mesh discretization

(II) Adding nodes

• Add nodes when there is a delta-v greater than T_M .

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 ト ● 回 ● の Q ()・

Adaptive remeshing

Changing the mesh discretization

(III) Remeshing depending on relative values of delta-v

- This procedure is applied when there are no nodes with a delta-v smaller than T_m or higher than T_M .
- Remove delta-v when they are very small when compared with the ones in a neighborhood.
- This is useful in situations where the bang-bang control is the optimal solution.

Remeshing - 1

Adaptive remeshing

Flow chart of the algorithm

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Adaptive remeshing

Bang-bang versus low thrust

• Bang-bang:

- When there is no collision risk with rectilinear trajectories, the optimum trajectory is a bang-bang control for each spacecraft.
- The bang-bang control is the critical case, because almost all delta-v are zero.
- After a few iterations, all the nodes are removed.

• Low thrust:

 Adding nodes, the total amount of delta-v is reduced and the trajectory tends to low thrust when adding more nodes.

Remeshing - 1

Adaptive remeshing
